                                                                                                                                  Š
                                                                                                                                                                     Ъ
                                                                                                                                                                                                                                                                                                                                              The invention relates to an isolated polypeptide (I) comprising an amino cadherin-like asymmetry protein(s) (CLASP-2) to one off the human cadherin-like asymmetry protein(s) (CLASP-2) (CLASP-2A). 2B, 2C, 2B) sequences (PS). (I) is useful for identifying a compound or agent that this cathera a cLASP-2 polypeptide. An antibody (II) to (I) is useful for cinhibiting a limmune response in a subject. A planmaceutical composition comprising a nucleic acid encoding (I), or (II) is useful for the autoimmune disease is caused or exacerbated by increased activity correctly continue a cLASP-2 polypeptide in a subject. A planmaceutical composition or inhibition of CLASP-2 expression (e.g., antisense or cribazyme-mediated inhibition), for gene knockout, etc. The CLASP-2 caplynucleotides are useful as probes or primers for cibryme-mediated inhibition), for gene knockout, etc. The CLASP-2 caplynucleotides or are useful as produce anti-CLASP-2 caplynucleotides or are useful as produce anti-CLASP-2 caplynucleotides or polypucleotides and therapeutic polypeptides. The CLASP-2 caplynucleotides can construct transgenic and knockout anti-CLASP-2 expression), as a lymphocyte marker and for therapeutic purposes. CLASP-2 polypucleotides can construct transgenic and knockout animals, e.g., for screening of CLASP-2 agonists and antagonists. CLASP-2 polypucleotides can treat deficiencies or disorders of the immune system, by activating or inhibiting the cativation, differentiation of immune calls and can treat or detect disorders of disorders (e.g., immunologic deficiency syndromes including the pluripotent stem calls to treat those disorders associated with a decrease in certain (or many) types of haematopoletic calls e.g., immunologic deficiency syndromes including blood protein disorders (e.g., agammaglobulinamia, or haematopoletic calls e.g., indunologic deficiency syndromes including blood protein disorders (e.g., agammaglobulinamia, or haematopoletic calls e.g., addison's disease, haemalytic anaemia, or inflammation.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    300
```

The invention relates to an isolated polypeptide (I) comprising a acid sequence that has 90 % sequence identity to one of the human cadherin-like asymmetry protein(s) (CLASP)-2 (hCLASP-2A, 2B, 2C, sequences (PS). (I) is useful for identifying a compound or agent

an

amino

```
detecting a cLASP-2 polypeptide. An antibody (II) is useful for classed and cLASP-2 polypeptide in a sample. (II) is useful for thibiting a immune response in a subject. A pharmaceutical composition comprising a nucleic acid encoding (I), or (II) is useful for preventing comprising a nucleic acid encoding (I), or (II) is useful for preventing cor treating a CLASP-2 mediated disease e.g. an autoimmune disease, where cor fill cells. CLASP-2 polynucleotides are useful as probes or primers for classed the autoimmune disease is caused or exacerbated by increased activity of the control of the classed activity of the cells and construct transgenic and knockout animals, e.g., for screening of cLASP-2 agonists and antagonists. CLASP-2 polypeptides or polynucleotides can construct transgenic and knockout animals, classed activation, differentiation of immune cells and can treat or detect deficiencies of disorders of haematopoietic cells. CLASP-2 polypeptides or classed activation and proliferation of immune cells and can treat or detect disorders associated with a decrease in certain (or many) types of haematopoietic cells, including the pluripotent stem cells to treat those classed activation and protein disorders (e.g., agammaglobulinaemia, variable classed, multiple sclerosis, rhoumatoid arthritis, lupus, and inclassed constructions of properties of the invention. Abdison's disease, haemolytic anaemia, or classed disease, can be used to treat anaphlaxis or creat can be used to treat anaphlaxis or ca
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Query Match

The invention relates to an isolated polypeptide (I) comprising an amino caid sequence that has 90 % sequence identity to one of the human cadherin-like asymmetry protein(s) (CLASP)-2 (hCLASP-2A, 2B, 2C, 2E) cequences (PS). (I) is useful for identifying a compound or agent that binds CLASP-2 polypeptide. An antibody (II) to (I) is useful for detecting a CLASP-2 polypeptide in a sample. (II) is useful for comprising a nucleic acid encoding (I), or (II) is useful for reating a CLASP-2 mediated disease e.g. an autoimmune disease, where the autoimmune disease is caused or exacerbated by increased activity of TH1 cells. CLASP-2 polynucleotides are useful as probes or ribozyme-mediated inhibition of CLASP-2 expression (e.g., antisense or cribozyme-mediated inhibition), for gene knockout, etc. The CLASP-2 polynucleotides can express CLASP-2 polypeptides, produce anti-CLASP-2 capression), as a lymphocyte marker and for therapeutic purposes. CLASP-2 polynucleotides can screen for CLASP-2 agonists and antagonists. CLASP-2 polynucleotides can screen for CLASP-2 agonists and antagonists. CLASP-2 polypeptides or polypeptides can treat deficiencies or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  an immune rarthritis, and sepsis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               thrombocytop

CLASP-2 polypeptides or polynucleotides can increase differentiation and proliferation of haematopoietic cells, including the pluripotent stem cells to treat those disorders associated with a decrease in certain (or many) types of haematopoietic cells e.g., immunologic deficiency syndromes including blood protein disorders (e.g., agammaglobulinaemia, common variable immunodeficiency, Digeorge syndrome, lymphopenia, thrombocytopenia, or haemoglobinuria). CLASP-2 polynucleotides or polypeptides can treat or detect autoimmune diseases, e.g., Addison's disease, haemolytic anaemia, crave's disease, multiple sclerosis, rheumatoid arthritis, lupus, endometriosis, autoimmune thyroiditis, and autoimmune pulmonary inflammation. CLASP-2 can be used to treat anaphylaxis or hypersensitivity to an antigenic molecules, organ rejection or graft-versus-host disease (GVHD) and inflammation. ABK84922-ABK85018 represent cadherin-like asymmetry protein (CLASP) coding sequences and Proliferation of the invention.

an immune arthritis, New human cadherin-like asymmetry protein(s) (CLASP)-2 for modulating cesponse, and for treating multiple sclerosis, rheumatoid endometriosis, lupus, autoimmune thyroiditis, septic shock

Disclosure Figure 1; 245pp; English.

of TH1 cells. CLASP-2 polynucleotides are useful as probes or primers for cribozyme-mediated inhibition), for gene knockout, etc. The CLASP-2 cantibodies or are used as therapeutic polynucleotides can express CLASP-2 polypeptides, produce anti- CLASP-2 cantibodies or are used as therapeutic polypeptides. The CLASP-2 colynucleotide or fragments can be used in diagnostics (e.g., as probes cfor CLASP-2 expression), as a lymphocyte marker and for therapeutic purposes. CLASP-2 polynucleotides can express class-2 polypeptides. The CLASP-2 colynucleotides can screening of CLASP-2 agonists and antagonists. CLASP-2 colynucleotides can screening of CLASP-2 agonists and antagonists. CLASP-2 colynucleotides or polynucleotides can treat deficiencies or clasp-2 polypeptides or polynucleotides can treat deficiencies or clasp-2 polypeptides or polynucleotides can treat deficiencies or clasp-2 polypeptides or polynucleotides can treat or detect deficiencies or disorders of the immune cystem, by activating or inhibiting the croplynucleotides can increase differentiation and proliferation of haematopoietic cells, including the pluripotent stem cells to treat those clasorders associated with a decrease in certain (or many) types of haematopoietic cells e.g., immunologic deficiency syndromes including blood protein disorders (e.g., agammaglobulinaemia, or haemoglobulinaemia, ataxia telangiectasia, common variable commondeficiency, Digeorge syndrome, lymphopenia, thrombocytopenia, or haemoglobulinaemia, claspes, e.g., Addison's disease, haemolytic anaemia, crave's disease, multiple sclerosis, rheumatoid arthritis, lupus, candometriosis, autoimmune thvroiditis, and antoimmune nulmonarv Grave's dis endometrios inflammatio hypersensit The invention relates to an isolated polypeptide (I) comprising an amino acid sequence that has 90 % sequence identity to one of the human cadherin-like asymmetry protein(s) (CLASP)-2 (hCLASP-2A, 2B, 2C, 2E) sequences (PS). (I) is useful for identifying a compound or agent that binds CLASP-2 polypeptide. An antibody (II) to (I) is useful for detecting a CLASP-2 polypeptide in a sample. (II) is useful for inhibiting a immune response in a subject. A pharmaceutical composition comprising a nucleic acid encoding (I), or (II) is useful for preventing or treating a CLASP-2 mediated disease e.g. an autoimmune disease, where the autoimmune disease is caused or exacerbated by increased activity tivity to an antigenic molecules, organ rejection or t disease (GVHD) and inflammation. ABK84922-ABK85018 , autoimmune thyroiditis, and autoimmune pulmonary CLASP-2 can be used to treat anaphylaxis or graft-

CC (CLASP-2). CLASP-2 can have immunosuppressive, immunomodulatory, antiarthritic, cytostatic, hypotensive, antirheumatic, antiinflammatory, antiarthritic, cytostatic, hypotensive, antirheumatic, contains and contains and neuroprotective activities. CLASP-2 can be contained in thibit an immune response in a subject by interfering with the containing of a CLASP-2 protein to bind to another T cell or B cell. An containing the containing and antibody which specifically binds to CLASP-2. CLASP-2 polynucleotides, contained disease, such as an autoimmune disease caused or exacerbated contained disease, such as an autoimmune disease caused or exacerbated by increased activity of TH11 cells. They can also be used to treat hypersensitivities, prevent transplantation rejection responses and cugment immune responsiveness in immunodeficiency states, inhibit colliferation and differentiation of cells involved in an inflammatory contained by disrupting clasp-2 function include multiple sclerosis, rheumatoid arthritis, endometriosis and pregnancy induced hypertension. The present sequence encodes human CLASP-2, which is used in the ceremplification of the present invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ine response in a subject may also be inhibited by administering an libody which specifically binds to CLASP-2. CLASP-2 polynucleotides, eins and antibodies can be used to prevent or treat a CLASP-2 lated disease, such as an autoimmune disease caused or exacerbated increased activity of TH11 cells. They can also be used to treat exensitivities, prevent transplantation rejection responses and ent immune responsiveness in immunodeficiency states, inhibit iferation and differentiation of cells involved in an inflammatory sonse e,g, arthritis, inflammatory bowel disease and increase iterentiation and proliferation of haematopoietic cells e.g. to treat maia, thrombocytopaenia and other blood protein disorders. Disorders and other blood protein disorders. Disorders ted by disrupting CLASP-2 function include multiple sclerosis, matoid arthritis, endometriosis and pregnancy induced hypertension. present sequence encodes human CLASP-2A, which is used in the present invention.

caunerin-like asymmetry protein(s) (CLASP-24, 28, 26, 28)

c sequences (PS). (I) is useful for identifying a compound or agent that binds CLASP-2 polypeptide in a sample. (II) to (I) is useful for identifying a compound or agent that compound or agent that the compound of the composition or inhibition and insert the autoimmune disease is caused or exacerbated by increased activity of the autoimmune disease is caused or exacerbated by increased activity of the autoimmune disease is caused or exacerbated by increased activity of the autoimmune disease is caused or exacerbated by increased activity of the autoimmune disease e.g. an autoimmune disease, where the autoimmune disease e.g. an autoimmune disease or ribozyme-mediated inhibition), for gene knockout, etc. The CLASP-2 polymucleotides can expression (e.g., antisease articipally etc. The CLASP-2 polymucleotides can construct transgenic and knockout antimals, e.g., for screening of CLASP-2 polypeptides. The CLASP-2 polymucleotides can construct transgenic and knockout animals, e.g., for screening of CLASP-2 agonists and antagonists. CLASP-2 polymucleotides can treat deficiencies or disorders of the immune cells and can treat or detect deficiencies or disorders of haematopoietic cells and can treat or detect deficiency. Dispersion of immune cells and can treat or detect automatic cells, including the pluripotent stem cells to treat those haematopoietic cells, including the pluripotent stem cells to treat those disorders associated with a decrease in certain (or many) types of haematopoietic cells, including the pluripotent stem cells to treat those haematopoietic deficiency, Dispersion or treat to cells and can be de

CC acid sequence that has 90 % sequence identity to one of the human CC cadherin-like asymmetry protein(s) (CLASP) 2 (hCLASP-2A, 2B, 2C, 2E) CC detecting a CLASP-2 polypeptide. An antibody (II) to (I) is useful for comprising a cumpound or agent that CC binds CLASP-2 polypeptide. An antibody (II) to (I) is useful for comprising a nucleic acid encoding (I), or (II) is useful for comprising a nucleic acid encoding (I), or (II) is useful for preventing corrections or inhibiting a immune classes is caused or exacerbated by increased activaty corrections or inhibition), for gene knockout, etc. The CLASP-2 polynucleotides are useful as probes or primers for complynucleotides can express CLASP-2 polynucleotides. The CLASP-2 coplynucleotides or are used as therapeutic polypeptides. The CLASP-2 coplynucleotide or fragments can be used in diagnostics (e.g., as probes coplynucleotide or fragments can be used in diagnostics (e.g., as probes coplynucleotides can screening of CLASP-2 agonists and antagonists. CLASP-2 polynucleotides can construct transgenic and knockout composed to the immune system, by activating or inhibiting the collisorders of the immune system, by activating or inhibiting the collisorders of the immune system, by activating or inhibiting the collisorders associated with a decrease in certain (or many) types of compositic cells, including the pluripotent stem cells to creat those construct collisors or disorders of haematopoletic cells clasp-2, immunologic deficiency syndromes including the pluripotent stem cells to creat those industrial telanguic tasian (or many) types of communodeficiency, Digeorge syndrome, lymphopenia, thrombocytopenia, or immunodeficiens, Digeorge syndrome, lymphopenia, thrombocytopenia, or immunodeficiens, Digeorge syndrome, lymphopenia, thrombocytopenia, or
                                                                                                            20

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Example
                                                                                                                                                                                                                                                                                                                             immunodeficiency, Digeorge syndrome, lymphopenia, thrombocytopenia, or haemoglobinuria). CLASP-2 polynucleotides or polypeptides can treat or detect autoimmune diseases, e.g., Addison's disease, haemolytic anaemia, Grave's disease, multiple sclerosis, rheumatoid arthritis, lupus, endometriosis, autoimmune thyroiditis, and autoimmune pulmonary inflammation. CLASP-2 can be used to treat anaphylaxis or hypersensitivity to an antigenic molecules, organ rejection or graft-versus-host disease (GVHD) and inflammation. ABK84922-ABK85018 represent cadherin-like asymmetry protein (CLASP) coding sequences and PCR primers of the invention.

C antibody which specifically binds to CLASP-2. CLASP-2 polynucleotides, proteins and antibodies can be used to prevent or treat a CLASP-2 mediated disease, such as an autoimmune disease caused or exacerbated by increased activity of TH11 cells. They can also be used to treat hypersensitivities, prevent transplantation rejection responses and augment immune responsiveness in immunodeficiency states, inhibit proliferation and differentiation of cells involved in an inflammatory cresponse e,g, arthritis, inflammatory bowel disease and increase differentiation and proliferation of haematopoietic cells e.g. to treat anaemia, thrombocytopaenia and other blood protein disorders. Disorders created by disrupting CLASP-2 function include multiple sclerosis, rheumatoid arthritis, endometriosis and pregnancy induced hypertension. The present sequence represents a preliminary CLASP-2 nucleotide sequence, from the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Query Match 100.0%;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present invention describes cadherin-like asymmetry protein-2 (CLASP-2). CLASP-2 can have immunosuppressive, immunomodulatory, antiinflammatory, antiarthritic, cytostatic, hypotensive, antirheumatic, antianaemic, haemostatic and neuroprotective activities. CLASP-2 can be used to inhibit an immune response in a subject by interfering with the ability of a CLASP-2 protein to bind to another T cell or B cell. An ability of a CLASP-2 protein to bind to another many almost an inhibited by interfering and the subject by subje
                                                                                                                                                                                                                                                                                                                                                                                                                         3011

CC (CLASP-2). CLASP-2 can have immunosuppressive, immunomodulatory, antianthritic, cytostatic, hypotensive, antirheumatic, cu antianaemic, haemostatic and neuroprotective activities. CLASP-2 can be considered to inhibit an immune response in a subject by interfering with the ability of a CLASP-2 protein to bind to another T cell or B cell. An immune response in a subject may also be inhibited by administering an contibody which specifically binds to CLASP-2. CLASP-2 polynucleotides, considered disease, such as an autoimmune disease caused or exacerbated by increased activity of TH11 cells. They can also be used to treat hypersensitivities, prevent transplantation rejection responses and augment immune responsiveness in immunodeficiency states, inhibit proliferation and differentiation of cells involved in an inflammatory response e.g., arthritis, inflammatory bowel disease and increase treated by disrupting CLASP-2 function include multiple sclerosis, rheumatoid arthritis, endometriosis and pregnancy induced hypertension. The present sequence represents a preliminary CLASP-2 nucleotide sequence, from the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   14-APR-1999;

antiinflammatory, antiarthritic, cytostatic, hypotensive, antirheumatic, antiinflammatory, haemostatic and neuroprotective activities. CLASP-2 can be used to inhibit an immune response in a subject by interfering with the ability of a CLASP-2 protein to bind to another T cell or B cell. An immune response in a subject may also be inhibited by administering an antibody which specifically binds to CLASP-2. CLASP-2 polynucleotides, proteins and antibodies can be used to prevent or treat a CLASP-2 mediated disease, such as an autoimmune disease caused or exacerbated by increased activity of THII cells. They can also be used to treat chypersensitivities, prevent transplantation rejection responses and augment immune responsiveness in immunodeficiency states, inhibit proliferation and differentiation of cells involved in an inflammatory crasponse e.g., arthritis, inflammatory bowel disease and increase differentiation and proliferation of haematopoietic cells e.g. to treat chipe the discussion of the multiple sclerosis, treated by disrupting CLASP-2 function include multiple sclerosis, theumatoid arthritis, endometriosis and pregnancy induced hypertension. The present sequence represents a preliminary CLASP-2 nucleotide sequence, from the present invention.

    (CLASP-2). CLASP-2 can have immunosuppressive, immunomodulatory, antiinflammatory, antiarthritic, cytostatic, hypotensive, antirheumatic, cused to inhibit an immune response in a subject by interfering with the classific antibody which specifically binds to cLASP-2. CLASP-2 polynucleotides, con be inhibited by administering an immune response in a subject may also be inhibited by administering an classific antibody which specifically binds to CLASP-2. CLASP-2 polynucleotides, concentrated disease, such as an autoimmune disease caused or exacerbated concentration and antibodies can be used to prevent or treat a CLASP-2 polynucleotides, concentrated disease and activity of TH11 cells. They can also be used to treat classed activities, prevent transplantation rejection responses and congment immune responsiveness in immunodeficiency states, inhibit confideration and differentiation of cells involved in an inflammatory concentration and proliferation of haematopoietic cells e.g. to treat consemia, thromboovtonsenia and other consenia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                       14-APR-1999;

                                                                                                                                                                                                                                                       δÕ
                                                                                                                                                                                                                                                                                                                                                             C(CLASP-2). CLASP-2 can have immunosuppressive, immunomodulatory, antiinflammatory, antiarthritic, cytostatic, hypotensive, antirheumatic, antiinflammatory, antiarthritic, cytostatic, hypotensive, antirheumatic, antiinflammatory, antiiarthritic, cytostatic, hypotensive, antirheumatic, antiinflammatory, antiinflammatory, antiinflammatory, antiinflammatory, antiinflammatory, can be used to inhibit an immune response in a subject by interfering with the immune response in a subject by interfering an immune response in a subject may also be inhibited by administering an immune response in a subject may also be inhibited by administering an antibody which specifically binds to CLASP-2. CLASP-2 polynucleotides, proteins and antibodies can be used to prevent or treat a CLASP-2 mediated disease, such as an autoimmune disease caused or exacerbated by increased activity of TH11 cells. They can also be used to treat chypersensitivities, prevent transplantation rejection responses and augment immune responsiveness in immunodeficiency states, inhibit proliferation and differentiation of cells involved in an inflammatory cresponse e,g, arthritis, inflammatory bowel disease and increase differentiation and proliferation of cells involved in an inflammatory created by disrupting CLASP-2 function include multiple sclerosis, treated by disrupting CLASP-2 function include multiple sclerosis, crheumatoid arthritis, endometriosis and pregnancy induced hypertension. The present sequence represents a preliminary CLASP-2 nucleotide sequence, from the present invention.

```

The present invention describes cadherin-like asymmetry protein-2 (CLASP-2). CLASP-2 can have immunosuppressive, immunomodulatory, antiinflammatory, antiarthritic, cytostatic, hypotensive, antirheumatic antianaemic, haemostatic and neuroprotective activities. CLASP-2 can be used to inhibit an immune response in a subject by interfering with the ability of a CLASP-2 protein to bind to another T cell or B cell. An

antirheumatic,

CLASP-2 polynucleotides, proteins and antibodies can be used to prevent or treat a CLASP-2 mediated disease, such as an autoimmune disease caused or exacerbated by increased activity of TH11 cells. They can also be used to treat hypersensitivities, prevent transplantation rejection responses and augment immune responsiveness in immunodeficiency states, inhibit proliferation and differentiation of cells involved in an inflammatory cresponse e,g, arthritis, inflammatory bowel disease and increase differentiation and proliferation of haematopoietic cells e.g. to treat clic anaemia, thrombocytopaenia and other blood protein disorders. Disorders created by disrupting CLASP-2 function include multiple sclerosis, rheumatoid arthritis, endometriosis and pregnancy induced hypertension. The present sequence represents a preliminary CLASP-2 nucleotide sequence; from the present invention.

                                                                               B
                                                                                                                                                                                                                                                        The present invention describes cadherin-like asymmetry protein-2 (CLASP-2). CLASP-2 can have immunosuppressive, immunomodulatory, antiinflammatory, antiarthritic, cytostatic, hypotensive, antirheumatic, antiinflammatory, antiarthritic, cytostatic, hypotensive, antirheumatic, antiinflammatory, antiarthritic, cytostatic, hypotensive, antirheumatic, antiinflammatory, antiinflammatory, antiinflammatory, can be used to inhibit an immune response in a subject by interfering with the daility of a CLASP-2 protein to bind to another T cell or B cell. An immune response in a subject may also be inhibited by administering an antibody which specifically binds to CLASP-2. CLASP-2 polynucleotides, proteins and antibodies can be used to prevent or treat a CLASP-2 mediated disease, such as an autoimmune disease caused or exacerbated by increased activity of TH11 cells. They can also be used to treat hypersensitivities, prevent transplantation rejection responses and augment immune responsiveness in immunodeficiency states, inhibit proliferation and differentiation of cells involved in an inflammatory response e, g, arthritis, inflammatory bowel disease and increase differentiation and proliferation of haematopoietic cells e.g. to treat anaemia, thrombocytopaenia and other blood protein disorders. Disorders treated by disrupting CLASP-2 function include multiple sclerosis, rheumatoid arthritis, endometriosis and pregnancy induced hypertension. The present sequence represents a preliminary CLASP-2 nucleotide sequence, from the present invention.
                                                                                                                                                      Query Matc

Patent No. US20020102267A1

GENERAL INFORMATION:

APPLICANT: Lu, Peter

APPLICANT: Garman, Jonathan David

APPLICANT: Candia III, Albert Frederick

APPLICANT: Arbor Vita Corporation

TITLE OF INVENTION: CLASP-5 Transmembrane Pr

FILE REFERENCE: 020054-000511US

CURRENT APPLICATION NUMBER: US/09/736,960

CURRENT FILING DATE: 2001-09-20

PRIOR APPLICATION NUMBER: US 60/160,860

PRIOR FILING DATE: 1999-10-21

PRIOR APPLICATION NUMBER: US 60/162,498
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          δã
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               US-0
